# CHAPTER 1

---

## PyCrop2ML documentation

---

### 1.1 Module description

#### 1.1.1 What is PyCrop2ML?

**PyCrop2ML** is a free, open-source library for defining and exchanging CropML models. It is used to generate components of modeling and simulation platforms from the CropML specification and allow component exchange between different platform.

It allows to parse the models described in CropML format and automatically generate the equivalent executable Python, java, C#, C++ components and packages usable from existing crop simulation platform.

#### 1.1.2 What is Crop2ML ?

**CropML** is a XML-(JSON-)based language used to represent different biological processes involved in the crop models.

CropML project aims to provide common framework for defining and exchanging descriptions of crop growth models between crop simulation frameworks.

### Objectives

Our main objectives are:

- define a **declarative language** to describe either an atomic model or a composition of models
- add semantic dimension to CropML language by annotation of the models to allow the composition of components of different platforms by using the standards of the semantic web
- develop a library to allow the transformation and the exchange of CropML model between different Crop modelling and simulation platform
- provide a **web repository** enabling registration, search and discovery of CropML Models

- facilitate Agricultural Model Exchange Initiative

## Context

Nowadays, we observe the emergence of plant growth models which are built in different platforms. Although standard platform development initiatives are emerged, there is a lack of transparency, reusability, and exchange code between platforms due to the high diversity of modeling languages leading to a lack of benchmarking between the different platforms.

This project aims to gather developers and plant growth modelers to define a standard framework based on the development of declarative language and libraries to improve exchange model components between platforms.

## Motivation

### Our motivation is to:

- Strengthen the synergy between crop modelers, users and scientific researchers
- Facilitate model intercomparison (at the process level) and model improvement through the exchange of model components (algorithms) and code reuse between platforms/models.
- Bridge the gap between ecophysicists who develop models at the process level with crop modelers and model users and facilitate the integration in crop models of new knowledge in plant science (i.e. we are seeking the exchange of knowledge rather than black box models).
- Increase capabilities and responsiveness to stakeholder' needs.
- Propose a solution to the AgMIP community for NexGen crop modeling tools.

## Vision

- Facilitate the development of complex models
- Use modular modelling to share knowledge and rapidly develop operational tools.
- Reuse model parts to leverage the expertise of third parties;
- Renovate legacy code.
- Realize the benefit of sharing and complementing different expertise.
- Promote model sharing and reuse

### 1.1.3 Crop2ML Description

In Crop2ML, a model is either a model unit or a composition of models. ModelUnit represents an atomic unit of a crop model. A model composition is a model resulting from the composition of two or more atomic model or composite models.

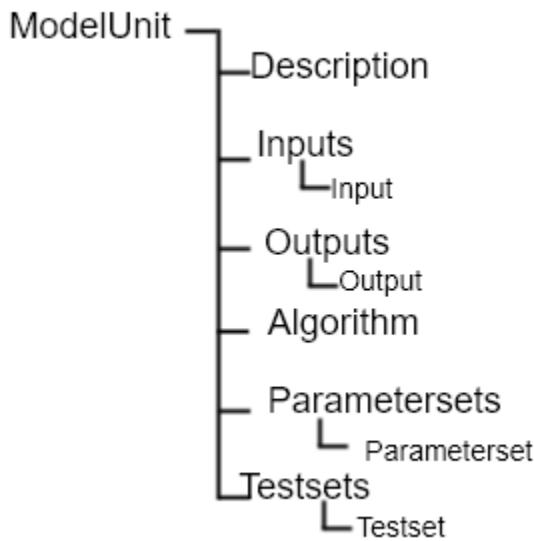

These models have a specific formal definition in Crop2ML.

#### Formal definition of a Model Unit in Crop2ML

The structure of a Model Unit in Crop2ML MUST be conform to a specific Document Type Definition named [ModelUnit.dtd](#).

So a Model Unit Crop2ML document is a XML document well-formed and also obeys the rules given in the ModelUnit structure.

This structure MAY be described by the below tree:

For more details, consult [Crop2ML model unit specification](#).

### Formal definition of a Composite Model in Crop2ML

A Composite Model Crop2ML is an assembly of processes which are described by a set of model units or a composition of models. Given a composite model is a model, this one has also inputs, outputs and internal state which describe the orchestration of different independent models composed.

The structure of a Composite Model in Crop2ML MUST conform to a specific Document Type Definition named [ModelComposition.dtd](#).

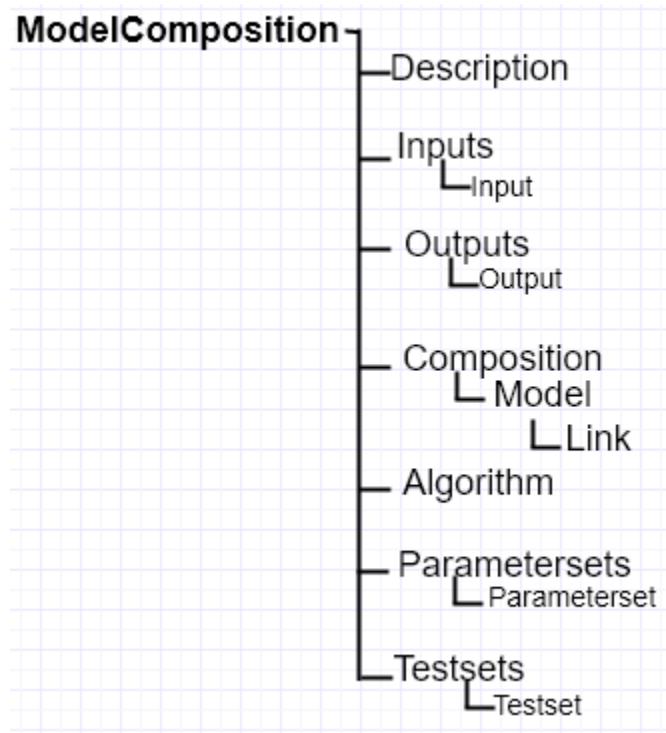

The composition is represented as a directed port graph of models:

Vertices are the different models that form the composition.

Ports are the inputs and outputs of each model.

Edges are directed and connect one output port to an input port of another model.

It contains in addition to all Elements of a model unit a Composition Element for the composition of models. This structure MAY be described by the below tree:

| For more details, consult [Crop2ML model composite specification](#) .

#### 1.1.4 CyML Language Specification

This document specifies the CyML language, an extended Cython subset supported.

#### 1.1.5 Cython file types

- The implementation files, carrying a `.pyx` suffix.

#### Basic Types

The following basic types are supported

- `bool`
- `int`
- `float`
- `double`
- `string`

#### Complex Types

The following complex types are supported

- array
- list
- datetime

## Conditional Statements

- IF
- IF/Else
- IF/ElseIf/Else

The ELIF and ELSE clauses are optional. An IF statement can appear anywhere that a normal statement or declaration can appear

## Integer For Loops

CyML recognises the usual Python for-in-range integer loop pattern:

```
for i in range(n):  
    ...
```

Like other Python looping statements, break and continue may be used in the body, without the loop that have an else clause.

## While Loop

- Like Python While loop

## Function

- Parameters with declaration
- Default value is possible

## Return Statement

- A function needs to return the same data type.

The following code is valid:

```
def fibonacci(int n):  
    if n <= 2:  
        return 1  
    else:  
        return fibonacci(n-1)+fibonacci(n-2)
```

## Call functions

- Call to CyML functions are supported if the function
- is accessible on the module
- is accessible from import statement

## Operators

### Assignment

Assign	<code>b = a</code>
--------	--------------------

### Unary operators

UAdd	<code>+a</code>
USub	<code>-a</code>

### Binary operators

Add	<code>a + b</code>
Sub	<code>a - b</code>
Mult	<code>a * b</code>
Div	<code>a / b</code>
FloorDiv	<code>a // b</code>
Pow	<code>a ** b</code>
Mod	<code>a % b</code>
LShift	<code>a &lt;&lt; b</code>
RShift	<code>a &gt;&gt; b</code>
BitOr	<code>a   b</code>
BitXor	<code>a ^ b</code>
BitAnd	<code>a &amp; b</code>

### Augmented assign statements

AugAdd	<code>a += b</code>
AugSub	<code>a -= b</code>
AugMult	<code>a *= b</code>
AugDiv	<code>a /= b</code>

### Comparison Operators

Eq	<code>a == b</code>
NotEq	<code>a != b</code>
Lt	<code>a &lt; b</code>
LtE	<code>a &lt;= b</code>
Gt	<code>a &gt; b</code>
GtE	<code>a &gt;= b</code>

### Bool Operators

<code>&amp;&amp;</code>	a and b
<code>  </code>	a or b

## Array creation routines

<code>“ “</code>	Return a new array of given shape and type, without initializing entries.
<code>“ “</code>	Return a new array of given shape and type, filled with ones.
<code>“ “</code>	Return a new array of given shape and type, filled with zeros.

## Mathematical functions

### Trigonometric functions

<code>sin(x)</code>	Trigonometric sine, element-wise.
<code>cos(x)</code>	Cosine elementwise.
<code>tan(x)</code>	Compute tangent element-wise.
<code>arcsin(x)</code>	Inverse sine, element-wise.
<code>arccos(x)</code>	Trigonometric inverse cosine, element-wise.
<code>arctan(x)</code>	Trigonometric inverse tangent, element-wise.

### Hyperbolic functions

<code>sinh(x)</code>	Hyperbolic sine, element-wise.
<code>cosh(x)</code>	Hyperbolic cosine, element-wise.
<code>tanh(x)</code>	Compute hyperbolic tangent element-wise.

## 1.1.6 PyCrop2ML User Guide

**Version** 1.1.0

**Release** 1.1.0

**Date** Oct 07, 2020

This reference manual details functions, modules, and objects included in OpenAlea.Core, describing what they are and what they do. For a complete reference guide, see core\_reference.

**Warning:** This “Reference Guide” is still very much in progress. Many aspects of OpenAlea.Core are not covered.

## Manual

---

**Note:** The following examples assume you have installed the packages and setup your python path correctly.

---

## Installation

```
conda install -c openalea pycropml
```

or

```
python setup.py install
```

## Overview of the different classes

### 1.1.7 src

#### pycropml package

##### Subpackages

##### pycropml.interface package

###### Submodules

###### pycropml.interface.design module

###### pycropml.interface.version module

Maintain version for this package. Do not edit this file, use ‘version’ section of config.

```
pycropml.interface.version.MAJOR = 0  
(int) Version major component.
```

```
pycropml.interface.version.MINOR = 0  
(int) Version minor component.
```

```
pycropml.interface.version.POST = 2  
(int) Version post or bugfix component.
```

##### Module contents

#### pycropml.transpiler package

##### Subpackages

##### pycropml.transpiler.generators package

##### Submodules

## pycroml.transpiler.generators.checkGenerator module

```
class pycroml.transpiler.generators.checkGenerator.CheckCompo(tree,
                                                               model=None,
                                                               name=None)
Bases: pycroml.transpiler.generators.checkGenerator.CheckGenerator

This class used to generates states, rates and auxiliary classes for C# languages.

class pycroml.transpiler.generators.checkGenerator.CheckGenerator(tree,
                                                               model=None,
                                                               name=None)
Bases: pycroml.transpiler.codeGenerator.CodeGenerator, pycroml.transpiler.rules.pythonRules.PythonRules

This class contains the specific properties of python language and use the NodeVisitor to generate a python code source from a well formed syntax tree.

## **pycropml.transpiler.generators.openaleaGenerator module**

**class** `pycropml.transpiler.generators.openaleaGenerator.OpenaleaCompo (tree, model=None, name=None)`

Bases: `pycropml.transpiler.generators.pythonGenerator.PythonCompo`

This class used to generates states, rates and auxiliary classes for C# languages.

**generate\_factory (model)**

Create a Node Factory from CropML model unit.

**generate\_wralea (mc)**

Generate wralea factories from the meta-information of the the model units.

**class** `pycropml.transpiler.generators.openaleaGenerator.OpenaleaGenerator (tree=None, model=None, name=None)`

Bases: `pycropml.transpiler.generators.pythonGenerator.PythonGenerator`

This class contains the specific properties of OpenAlea and use the NodeVisitor to generate a csharp code source from a well formed syntax tree.

`pycropml.transpiler.generators.openaleaGenerator.openalea_interface (inout)`

`pycropml.transpiler.generators.openaleaGenerator.signature (model)`

## **pycropml.transpiler.generators.pythonGenerator module**

**class** `pycropml.transpiler.generators.pythonGenerator.PythonCompo (tree, model=None, name=None)`

Bases: `pycropml.transpiler.generators.pythonGenerator.PythonGenerator`

This class used to generates states, rates and auxiliary classes for C# languages.

**class** `pycropml.transpiler.generators.pythonGenerator.PythonGenerator (tree, model=None, name=None)`

Bases: `pycropml.transpiler.codeGenerator.CodeGenerator, pycropml.transpiler.rules.pythonRules.PythonRules`

This class contains the specific properties of python language and use the NodeVisitor to generate a python code source from a well formed syntax tree.

### Submodules

#### pycropml.transpiler.Parser module

```
class pycropml.transpiler.Parser.opt(**kwds)
    Bases: object
```

```
pycropml.transpiler.Parser.parser(module)
```

Read, parse a Cython code and generate an abstract syntaxique tree.

Context: Compilation context: contains every pxd ever loaded, path information and the data related to the compilation. Class where it is implemented Cython parse method.

**options:** To set Compilation Options as language\_level: The source language level to use, formal\_grammar: to define if it will be used to Parse the file evaluate\_tree\_assertions: To evaluate parse tree show\_version : To display version number use\_listing\_file: Generate a .lis file errors\_to\_stderr: Echo errors to stderr when using .lis include\_path: Directories to search for include files output\_file: Name of generated .c file generate\_pxi: Generate .pxi file for public declarations capi\_reexport\_cincludes: Add cincluded headers to any auto-generated header files. timestamps: Only compile changed source files verbose : Always print source names being compiled compiler\_directives: Overrides for pragma options (see Options.py) embedded\_metadata: Metadata to embed in the C file as json. evaluate\_tree\_assertions: Test support: evaluate parse tree assertions cplus : Compile as c++ code

Here default options were used except language level

Scanning.FileSourceDescriptor: Represents a code source. Only file sources for Cython code supported

## pycroml.transpiler.api\_transform module

```
class pycroml.transpiler.api_transform.Standard
    Bases: object

    Standard classes should respond to expand and to return valid nodes on expand

class pycroml.transpiler.api_transform.StandardCall(namespace, function, expander=None)
    Bases: pycroml.transpiler.api_transform.Standard

```

## pycropml.transpiler.helpers module

```
pycropml.transpiler.helpers.prepare_table (types, original_methods=None)
pycropml.transpiler.helpers.safe_serialize_type (l)
    serialize only with letters, numbers and _
pycropml.transpiler.helpers.serialize_type (l)
```

## pycropml.transpiler.interface module

```
class pycropml.transpiler.interface.TreeInterface (tree)
    Bases: object
    visits recursively nodes of the tree with defined transform_<node_type> methods and transforms in place
    transform (tree, in_block=False)
    transform_block (tree)
    transform_default (tree)

class pycropml.transpiler.interface.middleware (tree)
    Bases: pycropml.transpiler.interface.TreeInterface
    api_translate ()
```

## pycropml.transpiler.main module

### pycropml.transpiler.nodeVisitor module

```
class pycropml.transpiler.nodeVisitor.NodeVisitor
    Bases: object
    Define a method which browse the graph and call a methode constructed from the type of each node of the graph
    visit (node)
```

### pycropml.transpiler.pseudo\_tree module

```
class pycropml.transpiler.pseudo_tree.Node (type, **fields)
    Bases: object
    The new Node generated with specific properties. These properties are automatically set”
    Example: Node(type='local', name='l', pseudo_type="int") to represent a int variable declaration
    y
```

### pycropml.transpiler.version module

Maintain version for this package. Do not edit this file, use ‘version’ section of config.

```
pycropml.transpiler.version.MAJOR = 0
    (int) Version major component.
```

```
pycropml.transpiler.version.MINOR = 0
    (int) Version minor component.
```

```
pycropml.transpiler.version.POST = 2
    (int) Version post or bugfix component.
```

## Module contents

#### pycropml.code2nbk module

#### pycropml.composition module

Read xml representation of a model composite

```
class pycropml.composition.Description
    Bases: object
```

Model Composition Description.

A description is defined by:

- Title
- Authors
- Institution
- Reference
- Abstract

```
class pycropml.composition.ModelComposition(kwds)
    Bases: pycropml.composition.ModelDefinition
```

Formal description of a Model Composite.

```
add_description(description)
```

TODO

```
class pycropml.composition.ModelDefinition(kwds)
Bases: object
    Model name, id, version and step

class pycropml.composition.ModelParser
Bases: pycropml.composition.Parser
    Read an XML file and transform it in our object model.

Composition(elts)
Description (Title, Author, Institution, Reference, Abstract)
Initialization(elt)
Links(elt)
    Retrieve different types of links
Model(elt)
    Models
ModelComposition(elts)
    ModelComposition (Description, Models, Inputlink,Outputlink,externallink)
dispatch(elt)
parse(fn)

class pycropml.composition.Models(name, modelid, file, package_name=None)
Bases: pycropml.composition.ModelComposition, pycropml.modelunit.ModelUnit

class pycropml.composition.Parser
Bases: object
    Read an XML file and transform it in our object model.

dispatch(elt)
parse(fn)

pycropml.composition.model_parser(fn)
Parse a composite model and return the model.

Returns ModelComposite object of the CropML Model.

pycropml.composition.retrieve_path(fn)
```

## **pycropml.cyml module**

### **pycropml.description module**

```
class pycropml.description.Description
Bases: object
    Model Unit Description.

A description is defined by:

- Title
- Author
- Institution

```

- Reference
- Abstract

## pycropml.error module

Created on Wed Apr 10 17:01:34 2019

@author: midingoy

```
exception pycropml.error.Error(message)
Bases: Exception
```

## pycropml.formater\_f90 module

```
pycropml.formater_f90.formater(code)
pycropml.formater_f90.formaterNext(line)
```

## pycropml.function module

```
class pycropml.function.Function(name, language, filename, type, description)

```

```
class pycropml.inout.Output(kwds)
Bases: pycropml.inout.InputOutput
```

## pycropml.main module

### pycropml.model module

### pycropml.modelunit module

Model Description and Model Unit.

```
class pycropml.modelunit.ModelDefinition(kwds)
Bases: object

class pycropml.modelunit.ModelUnit(kwds)
Bases: pycropml.modelunit.ModelDefinition

    Formal description of a Model Unit.

    add_description(description)
        TODO
```

## pycropml.package module

from pycropml import composition from pycropml.pparse import model\_parser from path import Path import networkx as nx from collections import defaultdict from IPython.display import Image, display from networkx.drawing.nx\_pydots import to\_pydot from pycropml.render\_cyml import signature

```
class pycropml.package.AbstractPackageReader(filename)
Bases: object

    Abstract class to add a package in the package manager.

    register_packages(pkgmanager)
        Create and add a package in the package manager.

class pycropml.package.Package(name, metainfo, path=None)
Bases: pycropml.package.PackageDict

    A Package is a dictionary of node factory. Each node factory is able to generate node and their widgets. Meta informations are associated with a package.

    add_modelunit(modelunit)
        Add to the package a factory ( node or subgraph )

    get_crop2ml_path()
        Return the full path of the wrlea.py (if set)

    get_id()
        Return the package id

    get_metainfo(key)
        Return a meta information. See the standard key in the __init__ function documentation. :param key: todo

    get_modelunit(modelid)
        Return the factory associated with id

    get_names()
        Return all the factory names in a list

    get_pkg_files()
        Return the list of xml filename of the package. The filename are relative to self.path

    get_tip()
        Return the package description

    is_directory()
        New style package. A package is embeded in a unique directory. This directory can not contain more than one package. Thus, you can move, copy or delete a package by acting on the directory without ambiguity.
        Return True if the package is embeded in a directory.

    is_editable()
        A convention (for the GUI) to ensure that the user can modify the package.
```

```

mimetype = 'pycrop2ml/package'

reload()
    Reload all xml file of the package

remove_files()
    Remove pkg files

update_modelunit (old_name, modelunit)
    Update factory (change its name)

class pycropml.package.PackageDict (*args)
Bases: dict

Dictionnary with case insensitive key This object is able to handle protected entry begining with an '#'

get (key, default=None)
    Return the value for key if key is in the dictionary, else default.

has_key (key)

iter_public_values ()
    Iterate through dictionnary value (remove protected value)

nb_public_values ()
    Return the number of unprotected values

class pycropml.package.PackageManager
Bases: object

add_crop2ml_path (path, container)
    Add a search path for wralea files

Parameters
    • path – a path string
    • container – set containing the path

add_package (package)
    Add a package to the pkg manager

clear ()
    Remove all packages

create_readers (crop2ml_files)

find_and_register_packages (no_cache=False)
    Find all composite model on the system and register them If no_cache is True, ignore cache file

find_crop2ml_dir (directory, recursive=True)
    Find in a directory wralea files, Search recursivly is recursive is True
    :return : a list of pkgreader instances

get (*args)

get_pkgreader (filename)
    Return the pkg reader corresponding to the filename

has_key (*args)

init (dirname=None, verbose=True)
    Initialize package manager
    If dirname is None, find composition files on the system else load directory

```

```
items()
iteritems()
iterkeys()
itervalues()
keys()

load_directory(dirname)
    Load a directory containing wraleas

rebuild_category()
    Rebuild all the category

reload(pkg=None)
    Reload one or all packages. If the package pkg is None reload all the packages. Else reload only pkg.

set_sys_crop2ml_path()
    Define the default composition files search path

    For that, we look for “composition” entry points and deprecated_wrlea entry point if a package is declared
    as deprecated_wrlea, the module is not load

update_category(package)
    Update the category dictionary with package contents

values()

class pycroml.package.PseudoGroup(name)
    Bases: pycroml.package.PackageDict

    Data structure used to separate dotted naming (packages, category)

    add_name(name, value)
        Add a value in the structure with the key name_tuple

    get_id()
        todo

    get_tip()
        todo

    mimetype = 'pycrop2ml/package'

    new(name)
        todo

    sep = '.'

class pycroml.package.PyPackageReader(filename)
    Bases: pycroml.package.AbstractPackageReader

    Build packages from wrlea file Use ‘register_package’ function

    build_package(wrleamodule, pkgmanager)
        Build package and update pkgmanager

    filename_to_module(filename)
        Transform the filename ending with .py to the module name

    get_pkg_name()
        Return the OpenAlea (uniq) full package name
```

```

register_packages (pkgmanager)
    Execute model.py

class pycropml.package.PyPackageReaderModel (filename)
    Bases: pycropml.package.PyPackageReader
        Build a package from a __wralea__.py Use module variable

    build_package (wraleamodule, pkgmanager)
        Build package and update pkgmanager

    check_exist ()

    contain_pkg (pkg)

    get_path (pkg, name)

class pycropml.package.PyPackageWriter (package)
    Bases: object
        Write a wralea python file

    get_str ()
        Return string to write

    pkg_template = '\n$PKGNAME\n$METAINFO\n'

    wralea_template = '\n# This file has been generated at $TIME\n$PKG_DECLARATION\n'

    write_wralea (full_filename)
        Write the wralea.py in the specified filename

exception pycropml.package.UnknownNodeError (name)
    Bases: Exception

class pycropml.package.UserPackage (name, metainfo, path=None)
    Bases: pycropml.package.Package
        Package user editable and persistent

pycropml.package.get_default_home_dir ()
    Return the home directory (valid on linux and windows)

pycropml.package.get_openalea_home_dir (name='pycrop2ml')
    Return the crop2ml home directory If it doesn't exist, create it

pycropml.package.get_userpkg_dir (name='user_pkg')
    Get user package directory (the place where are the wralea.py files). If it doesn't exist, create it

pycropml.package.is_protected (item)
    Return true the item is protected

pycropml.package.lower (item)

pycropml.package.protected (item)
    Return corresponding protected name for item

```

## pycropml.parameterset module

```

class pycropml.parameterset.Parameterset (name, description, uri=None)
    Bases: object
        Parameter set

```

`pycropml.parameterset.parameterset(model, name, kwds)`

## **pycropml.pparse module**

License, Header

**class** `pycropml.pparse.ModelParser`

Bases: `pycropml.pparse.Parser`

Read an XML file and transform it in our object model.

**Algorithm** (*elt*)

**Description** (*Title, Author, Institution, Reference, Abstract*)

**Function** (*elt*)

**Initialization** (*elt*)

**Input** (*elts*)

**Inputs** (*Input*)

**ModelUnit** (*elts*)

ModelUnit (Description,Inputs,Outputs,Algorithm,Parametersets, Testsets)

**Output** (*elts*)

**Outputs** (*elts*)

Ouputs (Output)

**Parameterset** (*elts*)

**Parametersets** (*Parameterset*)

**Testset** (*Test*)

**Testsets** (*Testset*)

**dispatch** (*elt*)

**param** (*pset, elt*)

Param

**parse** (*crop2ml\_dir*)

**class** `pycropml.pparse.Parser`

Bases: `object`

Read an XML file and transform it in our object model.

**dispatch** (*elt*)

**parse** (*crop2ml\_dir*)

`pycropml.pparse.model_parser(crop2ml_dir)`

**Parse a set of models as xml files contained in crop2ml directory** and algorithm in src directory This function returns models as python object.

Returns ModelUnit object of the Crop2ML Model.

## pycropml.render\_R module

Add License, Header.

Use pkglets

Problems: - name of a model unit?

```
class pycropml.render_R.Model2Package (models, dir=None, pkg_name=None)
    Bases: object

    TODO

    generate_func_test (model_unit)
    generate_function_doc (model_unit)
    generate_test (model_unit)

    num = 0

    run ()
    TODO.

    write_tests ()
    TODO: Manage several models rather than just one.

pycropml.render_R.comment (line)
pycropml.render_R.generate_doc (model)
pycropml.render_R.signature (model)
pycropml.render_R.transf (type_v, elem)
```

## pycropml.render\_cpp module

Add License, Header.

Use pkglets

Problems: - name of a model unit?

```

## pycropml.render\_notebook module

License, Header

Use pkglts

Problems: - name of a model unit?

```
class pycropml.render_notebook.Model2Nb (models, dir=None)  
Bases: pycropml.render_python.Model2Package
```

Generate a Jupyter Notebook from a set of models.

```
generate_notebook()
```

Generate a Python package equivalent to the xml definition.

Args: - models : a list of model - dir: the directory where the code is generated.

Returns: - None or status

```
generate_test (model_unit)
```

```
run()
```

TODO.

## pycropml.render\_notebook\_csharp module

License, Header

Use pkglts

Problems: - name of a model unit?

```
class pycropml.render_notebook_csharp.Model2Nb (models, dir=None)  
Bases: pycropml.render_csharp.Model2Package
```

Generate a Jupyter Notebook from a set of models in Csharp.

```
generate_notebook()
    Generate a csharp package equivalent to the xml definition.

    Args: - models : a list of model - dir: the directory where the code is generated.

    Returns: - None or status

generate_test (model_unit)

run()
    TODO.

pycropml.render_notebook_csharp.signature (model)

```

## pycropml.render\_python module

Add License, Header.

Use pkglets

Problems: - name of a model unit?

```
class pycropml.render_python.Model2Package(models, dir=None, pkg_name=None)
Bases: object

TODO

DATATYPE = {'BOOLEAN': <class 'bool'>, 'CHARLIST': <class 'list'>, 'DATE': <class 'str'>}

generate_algorithm(model_unit)
generate_component(model_unit)
Todo

generate_factory(model)
    Create a Node Factory from CropML model unit.

generate_func_test(model_unit)
generate_function_doc(model_unit)
generate_function_signature(model_unit)

generate_package()
    Generate a Python package equivalent to the xml definition.

    Args: - models : a list of model - dir: the directory where the code is generated.

    Returns: - None or status

generate_test(model_unit)
generate_wralea()
    Generate wralea factories from the meta-information of the the model units.

num = 0

run()
TODO.

write_tests()
    TODO: Manage several models rather than just one.

pycropml.render_python.generate_doc(model)
pycropml.render_python.openalea_interface(inout)
pycropml.render_python.signature(model)
```

## pycropml.test\_generator module

### pycropml.topology module

### pycropml.version module

Maintain version for this package. Do not edit this file, use ‘version’ section of config.

```
pycropml.version.MAJOR = 1
    (int) Version major component.

pycropml.version.MINOR = 1
    (int) Version minor component.

pycropml.version.POST = 0
    (int) Version post or bugfix component.
```

## pycropml.wf2xml module

### pycropml.writeTest module

Created on Mon Mar 18 15:46:31 2019

@author: midingoy

**class** pycropml.writeTest.**WriteTest** (*models*, *language*, *dir*)

Bases: `object`

**write()**

Populate and write the test files.

## pycropml.writeTest\_f90 module

Created on Thu Mar 28 15:39:28 2019

@author: midingoy

Add License, Header.

### 1.7.3 People

[[Stefan Behnelhttp://scoder.behnel.de/|Stefan Behnel]], [[Robert Bradshawhttp://www.math.washington.edu/~robertwb/|Robert Bradshaw]], [[Dag Seljebotnhttp://heim.ifi.uio.no/dagss/|Dag Seljebotn]], Lisandro Dalcin.

### 1.7.4 Mailing Lists

Our development mailing list is [[cython-devlhttp://mail.python.org/mailman/listinfo/cython-devel|cython-dev]] and user mailing list at <http://groups.google.com/group/cython-users>.

In the past we also used a [[Google grouplhttp://groups.google.com/group/cython|Google group]] and a list at [[BerliOS Developerhttps://lists.berlios.de/mailman/listinfo/cython-devel|BerliOS Developer]]. You can still read [[the archives at Gmanelhttp://blog.gmane.org/gmane.comp.python.cython.devel|the archives at Gmane]].

### 1.7.5 Project Goals

- Fully supported easy-to-use test suite, including the normal CPython test suite.
- Easy installation and usage.
- Rich, accessible documentation. Make sure the examples are plenty and can be automatically tested.
- Make Cython part of the standard distribution of Python (like ctypes).
- Compile all Python code except for possibly some obvious exclusions, which will be worked out by developers.
- Very fast when the user explicitly declares types (but we're not going to make promises with type inference). Precise benchmarks.
- Mitigate or eliminate the need for users to invoke the Python/C API directly without sacrificing performance.

### 1.7.6 Documentation

- See <http://docs.cython.org/>.
- Official Pyrex [[Language Overviewlhttp://www.cosc.canterbury.ac.nz/greg.ewing/python/Pyrex/version/Doc/LanguageOverview]] (note the [[changeslhttp://hg.cython.org/cython|changes]] though).
- [[Extension Typeslhttp://www.cosc.canterbury.ac.nz/greg.ewing/python/Pyrex/version/Doc/Manual/extension\_types.html|Extension Types]]
- [[Sharing Declarations Between Pyrex Moduleslhttp://www.cosc.canterbury.ac.nz/greg.ewing/python/Pyrex/version/Doc/Manual/sharing\_declarations.html|Sharing Declarations Between Pyrex Modules]]
- [[FAQlhttp://www.cosc.canterbury.ac.nz/greg.ewing/python/Pyrex/version/Doc/FAQ.html|FAQ]]
- [[Quick Guide to Pyrexlhttp://dots.org/pyrex-guide/|Quick Guide to Pyrex]] from Michael Jason-Smith.
- CategoryCythonDoc lists pages that are related to Cython documentation.
- [[ Pure Python mode|pure Python mode]]
- SAGE Days 4 talk highlighting some of the [[differences between Pyrex and SageXlhttp://cython.org/talks/SageX.pdf|differences between Pyrex and SageX]] (the predecessor of Cython).
